PXle-5841 Specifications

PXle-5841 Specifications

This specifications document contains specifications for both the PXle-5841 Vector Signal Transceiver (VST) and the PXle-5841 when paired with the optional PXle-5655 local oscillator (LO).

Definitions

Warranted specifications describe the performance of a model under stated operating conditions and are covered by the model warranty. Warranted specifications account for measurement uncertainties, temperature drift, and aging. Warranted specifications are ensured by design or verified during production and calibration.

Characteristics describe values that are relevant to the use of the model under stated operating conditions but are not covered by the model warranty.

- **Typical** specifications describe the performance met by a majority of models.
- **Typical-95** specifications describe the performance met by 95% ($\approx 2\sigma$) of models with a 95% confidence.
- **Nominal** specifications describe an attribute that is based on design, conformance testing, or supplemental testing.
- **Measured** specifications describe the measured performance of a representative model.

Specifications are **Warranted** unless otherwise noted.

Conditions

All specifications are valid under the following conditions unless otherwise noted.

- 30 minute warm-up time
- Self-calibration is performed after the specified warm-up period has completed

- Calibration cycle is maintained
- The chassis fan mode is set to Auto when used in a chassis with ≥ 58 W slot-cooling capability or the fan mode is set to High when used in any other chassis
- Empty chassis slots contain slot blockers and EMC filler panels to minimize temperature drift and reduce emissions
- Modules are connected with NI cables as shown in the ***PXle-5841 Getting Started Guide***
- RFmx, NI-RFSA, or NI-RFSG instrument driver is used
- Calibration IP is used properly during the creation of custom FPGA bitfiles

Typical specifications do not include measurement uncertainty and are measured immediately after a device self-calibration is performed.

Unless otherwise noted, specifications assume the PXle-5841 is configured in the following default mode of operation:

- Reference Clock source: Onboard
- RF IN reference level: 0 dBm
- RF IN preamplifier: AUTO
- RF OUT power level: 0 dBm
- LO tuning mode: Fractional
- LO PLL loop bandwidth: Medium
- LO step size: 500 kHz
- LO frequency: 2.4 GHz
- LO source: Onboard LO

Unless otherwise noted, specifications assume the PXle-5841 with the PXle-5655 is configured in the following default mode of operation:

- Reference Clock source: Onboard (from the PXle-5655)
- RF IN reference level: 0 dBm
- RF IN preamplifier: AUTO
- RF OUT power level: 0 dBm
- LO tuning mode: Fractional
- LO PLL loop bandwidth: Low
- LO step size: 500 kHz
- LO frequency: 2.4 GHz
- LO source: Onboard LO (from the PXle-5655)

Warranted specifications are valid over temperature ranges described in the ***Environmental Characteristics*** section of this document unless otherwise noted.

Specifications are identical for the PXle-5841 and the PXle-5841 with the PXle-5655 unless otherwise noted.

Common NI Terminology for RF Settings

Refer to the following list for definitions of common NI terms related to software-configured settings for the PXle-5841 and used throughout this document.

Table 1. Common Terminology Definitions

Term	Definition
<i>Center Frequency</i>	Refers to the IQ Carrier Frequency property in NI-RFSA, the Frequency property in NI-RFSG, and the Center Frequency property in RFmx.
<i>Offset Mode is Automatic</i>	Refers to the NI-RFSA Downconverter Frequency Offset Mode property or NI-RFSG Upconverter Frequency Offset Mode property set to Automatic. The PXle-5841 uses a direct conversion architecture. Offset Mode allows the instrument to operate in low IF mode, which increases the separation between the signal of interest and the residual sideband image and residual LO leakage power. However, low IF mode limits the available instantaneous bandwidth. A setting of Automatic allows the driver to set Offset Mode to Enabled when the signal bandwidth is configured as small enough to allow it. You can read back the Offset Mode to determine if the driver selected Enabled or User-Defined. Automatic is the default value. NI recommends keeping Offset Mode set to the default value.
<i>Offset Mode is Enabled</i>	Refers to the NI-RFSA Downconverter Frequency Offset Mode property or NI-RFSG Upconverter Frequency Offset Mode property

Term	Definition
	set to Enabled. Equivalent to <i>Signal Bandwidth</i> $\leq$ <i>Maximum Offset Bandwidth</i>. The PXle-5841 uses a direct conversion architecture. Offset Mode allows the instrument to operate in low IF mode, which increases the separation between the signal of interest and the residual sideband image and residual LO leakage power.
<i>Offset Mode is User-Defined</i>	Refers to the NI-RFSA Downconverter Frequency Offset Mode property or NI-RFSG Upconverter Frequency Offset Mode property set to User-Defined. Equivalent to <i>Signal Bandwidth</i> $>$ <i>Maximum Offset Bandwidth</i>. The PXle-5841 uses a direct conversion architecture. Offset Mode set to User-Defined allows the instrument to operate with maximum instantaneous bandwidth.
<i>Onboard</i>	Refers to the value of the LO Source property. A value of Onboard configures the hardware to use the PXle-5841 LO on an associated PXle-5655 (if present).

Frequency

The following characteristics are common to both RF IN and RF OUT ports.

Frequency range	9 kHz to 6 GHz
-----------------	----------------

Table 2. PXIe-5841 Bandwidth (Offset Mode is User-Defined)

Center Frequency	Instantaneous Bandwidth
9 kHz to <120 MHz	<120 MHz
120 MHz to 410 MHz	50 MHz
>410 MHz to 650 MHz	100 MHz
>650 MHz to 1.3 GHz	200 MHz
>1.3 GHz to 2.2 GHz	500 MHz
>2.2 GHz to 6 GHz	1 GHz

The PXIe-5841 uses the low frequency subsystem to directly acquire or generate the RF signal below 120 MHz.

Table 3. PXIe-5841 Bandwidth (Offset Mode is Enabled)

I/Q Carrier Frequency	Maximum Signal Bandwidth
9 kHz to <120 MHz	—
120 MHz to 378 MHz	10 MHz
>378 MHz to 593 MHz	35 MHz
>593 MHz to 1.168 GHz	85 MHz
>1.168 GHz to 1.943 GHz	235 MHz
>1.943 GHz to 6 GHz	485 MHz

The PXIe-5841 uses the low frequency subsystem to directly acquire or generate the RF signal below 120 MHz.

Tuning resolution	888 nHz
-------------------	---------

Note Tuning resolution combines LO step size capability and frequency shift digital signal processing (DSP) implemented on the FPGA.

Table 4. LO Step Size

Fractional mode	Programmable step size, 500 kHz default
Integer mode	LO ≤ 4 GHz 10 MHz, 20 MHz, 25 MHz, 50 MHz, 100 MHz

	LO > 4 GHz	20 MHz, 50 MHz, 100 MHz, 200 MHz
In integer mode, larger step sizes improve phase noise performance.		

Frequency Settling Time

Table 5. Frequency Settling Time, Typical (PXle-5841)

Accuracy	Settling Time (μs)
$\leq 1.0 \times 10^{-6}$ of final frequency	<380
$\leq 0.1 \times 10^{-6}$ of final frequency	<400
This specification includes only frequency settling and excludes any residual amplitude settling.	

Table 6. Frequency Settling Time, Typical (PXle-5841 with PXle-5655)

Accuracy	Maximum Time (μs), 0 °C to 55 °C
$\leq 1.0 \times 10^{-6}$ of final frequency	<175 μs
$\leq 0.1 \times 10^{-6}$ of final frequency or ± 25 Hz, whichever is greater	<200 μs

Internal Frequency Reference

Note Specifications are improved when using the PXle-5655. Refer to the ***Internal Frequency Reference*** section of the ***PXle-5655 Specifications*** for more information.

Initial adjustment accuracy	$\pm 200 \times 10^{-9}$
Temperature stability	$\pm 1 \times 10^{-6}$, maximum
Aging	$\pm 1 \times 10^{-6}$ per year, maximum

<0.1 dB of final value	70 μ s, typical

Conditions: constant RF input signal, varying input reference level.

RF Input Relative Amplitude Accuracy

Table 12. Input Relative Amplitude Accuracy (dB)

Center Frequency	Typical
10 MHz to <120 MHz	±0.35
120 MHz to 6 GHz	±0.2

Relative accuracy describes the residual absolute error when compared to the absolute accuracy error at 0 dBm reference level.

Conditions (10 MHz to <120 MHz): Reference level -30 dBm to +15 dBm; measured at the configured frequency; measurement performed after the PXIe-5841 has settled. Measured with a sine tone between -25 dBr to -5 dBr, where dBr is referenced to the configured RF reference level.

Conditions (120 MHz to 6 GHz): Reference level -30 dBm to +30 dBm; measured at 3.75 MHz offset from the configured center frequency when NI-RFSA Downconverter Frequency Offset Mode is User-Defined; measured at the configured center frequency when the NI-RFSA Downconverter Frequency Offset Mode is Enabled; measurement performed after the PXIe-5841 has settled. Preamplifier mode set to automatic. Measured with a sine tone within -25 dBr to -5 dBr, where dBr is referenced to the configured RF reference level.

Center frequency refers to NI-RFSA Downconverter Center Frequency when NI-RFSA Downconverter Frequency Offset Mode is User-Defined. Center frequency refers to NI-RFSA I/Q Carrier Frequency when NI-RFSA Downconverter Frequency Offset Mode is Enabled.

>4.5 GHz to 6 GHz	-62	-75	-62	-73	-63	-66

Conditions: Reference level 0 dBm. Preamplifier disabled. Measured with a single tone, -6 dBr, where dBr is referenced to the configured RF reference level. LO set to integer mode for downconverter center frequency ≤500 MHz.

Offset refers to ±desired signal offset (Hz) around the current downconverter center frequency.

(1 MHz ≤ offset): the maximum offset is limited to within the equalized bandwidth of the referenced LO frequency.

RF Input LO Residual Power

Downconverter Center Frequency	Reference Level	
	-30 dBm to <-20 dBm	-20 dBm to +30 dBm
Maximum residual LO power across full device bandwidth using the internal LO of the PXIe-5841. Input tone power at a maximum of -6 dBr. Measurement performed immediately after device self-calibration. The PXIe-5841 uses the low frequency subsystem to directly acquire the RF input signal below 120 MHz. Here dBr is relative to the full scale of the configured RF reference level.

Downconverter Center Frequency	NI-RFSA Device Instantaneous Bandwidth Setting	Input Bandwidth	Residual Sideband Image (dBc)
Conditions: Reference levels -30 dBm to +30 dBm. The PXIe-5841 uses the low frequency subsystem to directly acquire the RF signal below 120 MHz. This specification describes the maximum residual sideband image within the device bandwidth centered around a given RF center frequency. Measurement performed immediately after device self-calibration. The input bandwidth describes the occupied bandwidth of the input signal centered at the downconverter center frequency.

RF Output

RF Output Power Range

Table 21. Output Power Range

NI-RFSG Bandwidth Setting	Upconverter Center Frequency	Power Range, CW, Average Power	
		Specification	Nominal
<120 MHz	9 kHz to <120 MHz	Noise Floor to +5 dBm	Noise Floor to +8 dBm
≤200 MHz	120 MHz to 4 GHz	Noise Floor to +18 dBm	Noise Floor to ≥+20 dBm
	>4 GHz to 6 GHz	Noise Floor to +15 dBm	Noise Floor to ≥+17 dBm
1 GHz	≥2.2 GHz to 4 GHz	Noise Floor to +18 dBm	Noise Floor to ≥+20 dBm
	>4 GHz to 6 GHz	Noise Floor to +10 dBm	Noise Floor to ≥+15 dBm

The power range refers to CW average power. For modulated signal generation, it is important to consider the impact of peak to average power ratio (PAPR). For example, a modulated 20 MHz signal between 120 MHz to 4 GHz with a 12 dB PAPR can be generated with up to +6 dBm (+8 dBm, nominal) average modulated power.

Output attenuator resolution	1 dB, nominal
Digital attenuation resolution (average output power ≥ -100 dBm)	<0.1 dB

>500 MHz to 2.2 GHz	±0.25	±0.65
>2.2 GHz to 6 GHz	±0.25	±0.7

Relative accuracy describes the residual absolute accuracy error when compared to the absolute accuracy error at 0 dBm power level.

Conditions (10 MHz to <120 MHz): Power level -30 dBm to +5 dBm; measured at the configured frequency. Measurement performed after the PXIe-5841 has settled.

Conditions (120 MHz to 6 GHz): Power level -30 dBm to +15 dBm; measured at 3.75 MHz offset from the configured center frequency when NI-RFSG Upconverter Frequency Offset Mode is User-Defined; measured at the configured center frequency when NI-RFSG Upconverter Frequency Offset Mode is Enabled. Measurement performed after the PXIe-5841 has settled.

This specification is valid only when the module is operating within the specified ambient temperature range and within ±5 °C from the last self-calibration temperature, as measured with the onboard temperature sensors.

This specification requires that temperature correction is being performed. Temperature correction is applied automatically if NIRFSG_ATTR_AUTOMATIC_THERMAL_CORRECTION is enabled (default). Temperature correction is applied if necessary only when NI-RFSG settings are adjusted. If NIRFSG_ATTR_AUTOMATIC_THERMAL_CORRECTION is disabled, the niRFSG_PerformThermalCorrection must be explicitly called.

Center frequency refers to NI-RFSG Upconverter Center Frequency when NI-RFSG Upconverter Frequency Offset Mode is User-Defined. Center frequency refers to NI-RFSG I/Q Carrier Frequency when NI-RFSG Upconverter Frequency Offset Mode is Enabled.

>4.5 GHz to 6 GHz	-73	-86	-68	-89	-67	-65

Conditions: Output full scale 0 dBm. Measured with a single tone at 0 dBFS.

Offset refers to $\pm$ desired signal offset (Hz) around the current LO frequency.

The maximum offset is limited to within the equalized bandwidth of the referenced LO Frequency.

RF Output LO Residual Power
